

Facial Recognition Clock

iT100

The iT100 is Time Equipment Company's newest non-contact biometric offering that features both facial and iris recognition technology.

Why use the iT100?

Safety is paramount with today's modern workforce. Technology today allows increased safety and security without employees requiring an employee to touch a community surface.

Compliance is also necessary to maintain. Everchanging employment laws are requiring accurate measurement of breaks and lunches.

How does it work?

Employers now have a contactless clock that works with our time and attendance platform and meets the needs of organizations small and large.

The iT100 provides an easy-to-use solution with fast autofocus to conveniently authenticate identities at distances of up to 24 -30 inches.

The authentication process takes a second to complete making it fast and simple for employees.

- Once enrolled, the iT100 automatically recognizes the person's face, even with glasses or a mask.
- 'Buddy punching' - employees punching for another person - is eliminated.
- Automatic Tilt Adjustment
Camera finds the user and moves to a location where the user's eyes and face can be photographed.
